**WHICH FRAMEWORK
SHOULD YOU CHOOSE?**

IT DEPENDS

CHOOSE VUE

AN OVERVIEW OF

VUE.JS BASICS

AN INSTANCE OF VUE.JS

```
const app = new Vue({  
  // Determine the element your app will live in  
  el: "#app",  
  // Establishes the data you can use in the app  
  data: {  
    firstName: 'Ben',  
    lastName: 'Hong'  
  },  
  // Allows you to define functions that you can  
  // call in your app  
  methods: {  
    sayHello: function() {  
      alert('Hello!')  
    }  
  }  
})
```

EXPRESSIONS IN VUE.JS

```
<!-- Using data variables is easy! -->
```

```
<p>{{ firstName }} {{ lastName }}</p>
```

```
<!-- You can even do math! -->
```

```
<p>How about some math? {{ 11 * 11 }}</p>
```

```
<!-- Basic logic works as well! -->
```

```
<p>{{ onSale ? price * 0.8 : price }}</p>
```

**LET'S TALK ABOUT
DIRECTIVES**

Directives are the part of
Vue.js that are a bit **magical**...

WHAT ARE DIRECTIVES EXACTLY?

They are **Vue specific syntax** that flow you to accomplish common goals without worrying about how it is implemented

- ▶ v-if
- ▶ v-else-if
- ▶ v-else
- ▶ v-show
- ▶ v-for
- ▶ v-bind
- ▶ v-on
- ▶ v-model

V-IF / V-ELSE-IF / V-ELSE

Allows you to determine whether an element on the page should **exist**

```
<article>
  <h1>Dashboard</h1>
  <section v-if="userPermission === 'admin'">
    ...
  </section>
  <section v-else-if="userPermission === 'user'">
    ...
  </section>
  <section v-else>
    ...
  </section>
</article>
```

V-SHOW

Allows you to determine whether an element on the page should be **visible**

VS

V-IF / V-ELSE-IF / V-ELSE

Allows you to determine whether an element on the page should **exist**

Sam Saccone 

@samcccone

Following

99.7% of software development in one requirement

A user should be able to view a list of items.

1.8K

V-FOR

Allows us to “render a list of items based on an array (or object).”

```
<!-- Given the data model on the right -->
```

```
<ul>
  <li v-for="house in Hogwarts">
    {{ house }}
  </li>
</ul>
```

```
<!-- It will render to -->
```

```
<ul>
  <li>Ravenclaw</li>
  <li>Hufflepuff</li>
  <li>Slytherin</li>
  <li>Griffindor</li>
</ul>
```

```
// Given this sample Vue instance
```

```
new Vue({
  ...
  data: {
    Hogwarts: [
      'Ravenclaw',
      'Hufflepuff',
      'Slytherin',
      'Gryffindor'
    ]
  }
})
```

V-BIND

Allows us to manipulate HTML attributes with dynamic data

```
<!-- The long form -->  
<div v-bind:class="{ active: isActive }">...</div>  
  
<!-- The common shortcut -->  
<div :class="{ active: isActive }">...</div>  
  
<!-- If isActive is true, it will render -->  
<div class="active">...</div>
```

V-ON

Allows us to attach methods to HTML elements when a certain event occurs

```
<!-- The long form -->  
<div v-on:click="alert('Alohomora!')">...</div>  
  
<!-- The common shortcut -->  
<div @click="alert('Alohomora!')">...</div>
```

V-MODEL

Allows us to use two-way binding

```
<div id="app">
  <h1>{{ msg }}</h1>
  <label for="msg">Message</label>
  <input id="msg" type="text" v-model="msg" />
</div>
```

```
<script>
new Vue({
  el: '#app',
  data: {
    msg: ''
  }
})
</script>
```

ENOUGH TALKING.

FINAL THOUGHTS

**#1. ACCESSIBLE
TO DEVELOPERS
OF PRETTY MUCH
ALL ABILITIES**

```
import React from 'react';
import { render } from 'react-dom';
import Hello from './Hello';

const styles = {
  fontFamily: 'Avenir, Helvetica, Arial, sans-serif',
  textAlign: 'center',
  color: '#2c3e50',
  marginTop: '60px'
};

const App = () => (
  <div style={styles} className="app" id="app">
    <h1>This is a React.js component file!</h1>
  </div>
);

export default App
```

JSX EXAMPLE

```
<template>
  <div id="app" class="app">
    <h1>This is a Vue.js component file!</h1>
  </div>
</template>

<script>
export default {
  name: 'App'
}
</script>

<style>
.app {
  font-family: 'Avenir', Helvetica, Arial, sans-serif;
  -webkit-font-smoothing: antialiased;
  -moz-osx-font-smoothing: grayscale;
  text-align: center;
  color: #2c3e50;
  margin-top: 60px;
}
</style>

Introduction

What is Vue.js?

Vue (pronounced /vjuː/, like view) is a **progressive framework** for building user interfaces. Unlike other monolithic frameworks, Vue is designed from the ground up to be incrementally adoptable. The core library is focused on the view layer only, and is easy to pick up and integrate with other libraries or existing projects. On the other hand, Vue is also perfectly capable of powering sophisticated Single-Page Applications when used in combination with **modern tooling** and **supporting libraries**.

If you'd like to learn more about Vue before diving in, we **created a video** walking through the core principles and a sample project.

If you are an experienced frontend developer and want to know how Vue compares to other libraries/frameworks, check out the **Comparison with Other Frameworks**.

Getting Started

The official guide assumes intermediate level knowledge of HTML, CSS, and JavaScript. If you are totally new to frontend development, it might not be the best idea to jump right into a framework as your first step - grasp the basics then come back! Prior experience with other frameworks helps, but is not required.

Style Guide BETA

Rule Categories

- Priority A: Essential
- Priority B: Strongly Recommended
- Priority C: Recommended
- Priority D: Use with Caution

Priority A Rules: Essential

- Multi-word component names
- Component data
- Prop definitions
- Keyed v-for
- Avoid v-if with v-for
- Component style scoping
- Private property names

Priority B Rules: Strongly Recommended

- Component files
- Single-file component filename casing
- Base component names
- Single-instance component names
- Tightly coupled component names
- Order of words in component names

Style Guide

This is the official style guide for Vue-specific code. If you use Vue in a project, it's a great reference to avoid errors, bikeshedding, and anti-patterns. However, we don't believe that any style guide is ideal for all teams or projects, so mindful deviations are encouraged based on past experience, the surrounding tech stack, and personal values.

For the most part, we also avoid suggestions about JavaScript or HTML in general. We don't mind whether you use semicolons or trailing commas. We don't mind whether your HTML uses single-quotes or double-quotes for attribute values. Some exceptions will exist however, where we've found that a particular pattern is helpful in the context of Vue.

Soon, we'll also provide tips for enforcement. Sometimes you'll simply have to be disciplined, but wherever possible, we'll try to show you how to use ESLint and other automated processes to make enforcement simpler.

Finally, we've split rules into four categories:

Rule Categories

Priority A: Essential

These rules help prevent errors, so learn and abide by them at all costs. Exceptions may exist, but should be very rare and only be made by those with expert knowledge of both JavaScript
